

Enterprise Network Vulnerability Assessment Report

Target: 127.0.0.1 | Scan ID: scan_20261006_184304_d6c973 | Audit Date: 2026-10-06 18:43:26

Target Host	Scan Mode	Ports Scanned	Open Services	Duration
127.0.0.1	Curated (103)	103	5	21.66s

OVERALL RISK POSTURE: CRITICAL RISK
Weighted critical exposure rating derived from active NIST CVSS telemetry.

85/100
Critical Risk

Executive Summary

An automated network security assessment of target host 127.0.0.1 was conducted evaluating 103 TCP ports in Curated (103) mode. The assessment discovered 5 active listening service(s), with the maximum detected exposure reaching Critical severity and an overall risk score of 85/100 (Critical Risk). A total of 1 Critical finding(s) were correlated with publicly disclosed CVEs in NIST NVD, representing immediate vector risk. Top Priority Remediation: Configure Windows Update Delivery Optimization (WUDO) to local network peer sharing only or disable via Group Policy.

Severity Breakdown

Severity Tier	Findings Count	Percentage	Risk Significance
Critical	1	20.0%	Immediate remote exploit vector / high CVSS scoring
High	0	0.0%	Elevated exposure requiring priority mitigation
Medium	0	0.0%	Moderate service exposure or configuration weakness
Low	0	0.0%	Minor exposure requiring routine administrative review
Info / None	4	80.0%	Active service discovered without mapped CVE advisory

Open Ports & Services

Port/Proto	Service	Version / Banner	Severity	CVSS	Top CVE
7680/TCP	wudo	Windows Update Delivery Optimization	Critical	10.0	CVE-1999-0241
135/TCP	msrpc	Microsoft Windows RPC Endpoint Mapper	Unknown	—	None Found
445/TCP	microsoft-ds	Microsoft Windows SMB (v2/v3 Active)	Unknown	—	None Found
623/TCP	asf-rmcp	Intel Local Manageability Service	Unknown	—	None Found
5357/TCP	wsdapi	Microsoft WSDAPI Device Discovery	Unknown	—	None Found

Detailed Security Findings & Remediation

Critical Risk: Exposed Windows Update Delivery Optimization on Port 7680/TCP | Critical (CVSS 10.0)
Technical Observation: TCP port 7680 was confirmed in the OPEN state via TCP SYN/connect handshake. Protocol probing extracted banner: "Windows Update Delivery Optimization". Identified software product: Windows. Mapped host process: svchost.exe (PID: 2656). Correlated against NIST NVD with top matching advisory CVE-1999-0241 (CVSS 10.0) (Critical severity).
Remediation Directive: Configure Windows Update Delivery Optimization (WUDO) to local network peer sharing only or disable via Group Policy.

Active Service: Microsoft Windows RPC Endpoint Mapper on Port 135/TCP | Unknown (CVSS —)

Technical Observation: TCP port 135 was confirmed in the OPEN state via TCP SYN/connect handshake. Protocol probing extracted banner: "Microsoft Windows RPC Endpoint Mapper". Identified software product: Microsoft. Mapped host process: svchost.exe (PID: 1480). No active public CVEs directly mapped in NIST NVD for this service banner.

Remediation Directive: Restrict TCP port 135 to internal administrative jump hosts and domain controllers; block external inbound access.

Active Service: Microsoft Windows SMB (v2/v3 Active) on Port 445/TCP | Unknown (CVSS —)

Technical Observation: TCP port 445 was confirmed in the OPEN state via TCP SYN/connect handshake. Protocol probing extracted banner: "Microsoft Windows SMB (v2/v3 Active)". Identified software product: Microsoft. Mapped host process: System (PID: 4). No active public CVEs directly mapped in NIST NVD for this service banner.

Remediation Directive: Disable SMBv1 host-wide; apply latest Microsoft security updates; isolate port 445 to trusted administrative subnets via perimeter firewall.

Active Service: Intel Local Manageability Service on Port 623/TCP | Unknown (CVSS —)

Technical Observation: TCP port 623 was confirmed in the OPEN state via TCP SYN/connect handshake. Protocol probing extracted banner: "Intel Local Manageability Service". Identified software product: Intel. Mapped host process: LMS.exe (PID: 4588). No active public CVEs directly mapped in NIST NVD for this service banner.

Remediation Directive: Update Intel AMT firmware; isolate management interface to dedicated out-of-band management VLAN.

Active Service: Microsoft WSDAPI Device Discovery on Port 5357/TCP | Unknown (CVSS —)

Technical Observation: TCP port 5357 was confirmed in the OPEN state via TCP SYN/connect handshake. Protocol probing extracted banner: "Microsoft WSDAPI Device Discovery". Identified software product: Microsoft. Mapped host process: System (PID: 4). No active public CVEs directly mapped in NIST NVD for this service banner.

Remediation Directive: Disable Windows Web Services on Devices (WSDAPI) discovery if network printer/device discovery is not required.
